

INSTALLATION GUIDE

HOW TO INSTALL ARTIFICIAL GRASS

- 1 Strip turf, removing all the grass down by an average thickness of 40mm with a motorised turf cutter or spade.*

- 2 Spread and level 35mm of sharp builders sand.

- 3 Compact sand using either a builders plank and sledge hammer or motorised plate compactor. Re-smooth sand after completion.

- 4 Roll out weed retaining membrane on top of compacted sand. Overlap joints by 300mm leaving 50mm short of the grass edge. Peg down the weed membrane into the compacted sand.

- 5 Roll out grass to cover areas. Trim edges of grass rolls using a craft knife. It is easier to cut grass rolls from underneath.

- 6 Ensure grass rolls are butted together making sure no fibres are caught underneath. Lay all rolls in the same direction so the blades of grass all point in the same direction. Apply adhesive onto jointing tape and spread along join surface. Place roll edge onto tape making sure the fibres do not touch the glue. Ruffle the pile to disguise the joint.

- 7 Fixing to soft surface:
Fix down the edge using ground pins (angled to avoid lifting) every 200mm intervals. Ruffle the pile to disguise the pins. Optional - Nail the Artificial Grass to the wooden frame if used or use adhesive to fix the grass to the pegged down weed membrane.
Fixing to hard surface:
If fitting on to a hard surface like concrete, tarmac or patio then apply a line of glue along all the edges.

WHY CHOOSE ARTIFICIAL GRASS?

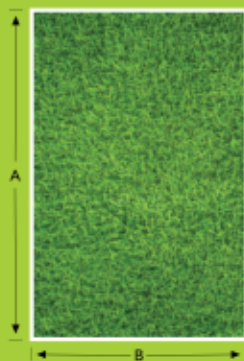

- ✓ LOOKS GREAT ALL SEASON
- ✓ NO MOWING
- ✓ NO WATERING
- ✓ CHILDREN AND PET FRIENDLY
- ✓ NO FEEDING
- ✓ HIGH UV RESISTANCE
- ✓ NATURAL GRASS LOOK
- ✓ EASY TO CUT INTO SHAPE
- ✓ HARD WEARING

HOW MANY ADHESIVE TUBES AND PINS WILL I NEED?

The most commonly needed accessories are the adhesive tubes & U-Pins. Each adhesive tube covers approx four linear meters. We recommend one U-Pin per linear meter if securing the perimeter of a project, two U-Pins per m² if securing through-out the entire area.

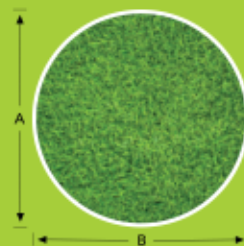

HOW TO MEASURE YOUR AREA

Example 1.

The general rule is $A \times B = \text{m}^2$ required. The prices displayed are m².

Example 2.

For irregular shapes, such as example 2, it is recommended the full area is calculated and purchased. Always measure to the longest and widest points of the area.

This is to ensure the pile is running the correct direction and minimal joins are needed.

Same rule applies $A \times B = \text{m}^2$. The prices displayed are m².
